OBJECTIVE

Full-Stack Developer (MERN + PostgreSQL) with hands-on experience building and deploying scalable web applications. Proven ability to architect production-grade systems, integrate real-time features, and apply modern DevOps practices. Seeking a software development internship to contribute to real-world products and grow within an engineering team.

EDUCATION

Lal Bahadur Shastri Professional Studies, Harda

Bachelor of Science in Computer Science

June 2024 – Present

- SGPA: 7.10 (1st Year)

TECHNICAL SKILLS

Languages: JavaScript, Java, HTML, CSS

Frontend: React.js, Next.js, Bootstrap

Backend: Node.js, Express.js

Databases: MongoDB, PostgreSQL, Prisma ORM

DevOps & Tools: Docker, Git, GitHub, VS Code

Concepts: REST APIs, MVC Architecture, JWT Authentication, Zod Validation, bcrypt, Error Handling, WebRTC, Socket.IO

PROJECTS

SmartSpend.ai – AI-Powered Personal Finance App | *Node.js, Express.js, PostgreSQL, Prisma ORM, Docker, Zod, bcrypt, JWT* | GitHub [In Progress]

- Architected a production-grade REST API following Routes → Middleware → Controllers → Services separation – each layer has a single responsibility, making the codebase easy to extend and debug
- Built a generic Zod validation middleware that validates any request schema – eliminates repeated validation logic across routes and returns structured error messages
- Implemented custom AppError class and global error handler – distinguishes operational errors from unexpected crashes and returns consistent JSON error responses
- Containerized PostgreSQL using Docker Compose for local development – eliminates environment-specific setup issues and keeps dev/prod parity
- Chose PostgreSQL over MongoDB for this project – relational data (users, transactions, budgets) benefits from schema enforcement and JOIN queries

Skill Share – Full Stack LinkedIn Clone | *Next.js, React, Node.js, Express.js, MongoDB, JWT* | Live | GitHub

- Built a full-stack social networking app with posts, likes, comments, user profiles, and connection requests – modeled data relationships in MongoDB with normalized schemas
- Chose JWT over session-based auth to keep the backend stateless – implemented protected routes and secure login/signup flow
- Designed REST APIs with MVC separation – controllers handle business logic independently of route definitions, improving testability
- Identified post-build security gap: JWT stored in localStorage is vulnerable to XSS – documented migration roadmap to HttpOnly cookies

Talk Sphere – Real-Time Conferencing App | *React, Node.js, Express.js, Socket.IO, WebRTC, JWT, MongoDB* | Live | GitHub

- Implemented P2P video/audio using WebRTC – handled signaling via Socket.IO to exchange SDP offers/answers and ICE candidates between peers
- Built group call support by managing multiple peer connections per room – each participant maintains individual RTCPeerConnection instances
- Added screen sharing and real-time chat alongside video – Socket.IO handles message broadcast while WebRTC handles media streams separately
- Stored chat history and call metadata in MongoDB – used JWT for session-based access control on Socket.IO events
